

Chapter 10: When Pregnant Women Fall ill

When a pregnant woman needs medication for any indisposition, she has to exercise utmost care in the consumption of medicines because the medicines are generally designed for adults and might not be compatible for the delicate foetus and affect it adversely. It cannot be predicted what effect the drugs might have on the foetus. It is a fact there is no medicine, which will not affect the foetus. This is the reason a pregnant mother must exercise maximum restraint in taking medicines.

Firstly, she should avoid intake of medicine. But if the condition of the health becomes such that medication becomes absolutely necessary, then she should have access to it on the expert advice of a medical practitioner who can suggest the right medicine and the dosage.

When the illness is risky for the mother and the child, the pregnant mother should obtain expert medical opinion and treatment, as, otherwise it might cause irreparable damage to the foetus.

One expert writes:

“It is possible that certain viruses and microbes escape from the mother and the father into the indefensible foetus and infect it with the same disease which the parents were suffering from.”

He writes at another place:

“Any change in the dietary habit of the mother, the medicines which she has to take and the diseases with which she gets afflicted will have effect on the embryo. Any diseased condition, which affects the embryo in the initial stages of conception, will progressively enhance. It is therefore imperative that the pregnant women should prevent themselves against diseases. Sometimes diseases may destroy their capacity to conceive in the future.

He also writes:

“There are several non-food materials which, when consumed by a pregnant mother, will adversely effect the development of the foetus. Most of the medicines are for adults and their trials are made only on grownups before they are approved for prescription. The viruses, bacteria and the germs in the body

of the mother sometimes affect the foetus too.

Sometimes the foetus starts getting the same symptoms of the disease or sometimes abnormal growth takes place in the foetus because of the infection." 1
